

A Cellular Phenotype: VIR Export & Multicellular Rosetting

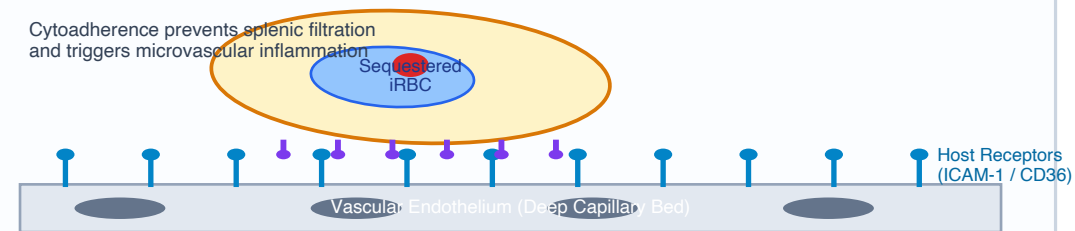

Infected erythrocyte binds uninfected red blood cells, driving microvascular obstruction

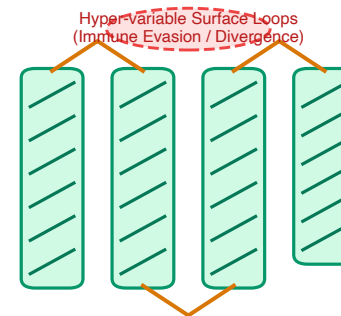

Rosetting Frequency: High rosetting strains correlate with severe anemia, respiratory distress (ARDS), and microvascular blockade.

B Pathogenesis & Structural Unification

Conserved mostly- α -helical fold mediates receptor cytoadherence

Conserved PIR Ectodomain Fold (Harrison & Higgins, PDB 6ZYV)

- Rigid α -helical bundle preserved across family
- 3Di structural alphabet captures backbone states
- Explains unification: 73 structural classes vs 146 sequence subfamilies
